New peptide conjugates for modulating apoptosis ç for inhibiting

```
CC (R-X)n-peptide where n = 1-10; X = C-0, when the R-X group is attached CC (R-X)n-peptide where n = 1-10; X = C-0, when the R-X group is attached CC to the N-terminus of the peptide, or a side chain of the peptide where CC when the R-X group is attached to the C-terminus of the peptide, or a ... CC when the R-X group is attached to the C-terminus of the peptide, or a ... CC side chain of the peptide, where the side chain functional group is COOH; CC or COOH3; and R = 2-18C alkyl or alkoxy, 2-14C alkylenyl containing one CC or two double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally CC phenyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, CC phenyl group, or benzyl. The peptide corresponding to amino acids 72-97 of CC alkyl group, or benzyl. The peptide corresponding to amino acids 72-97 of CC of the BH3 domain of the cell death agonist Bad. The peptide conjugate is CC of the BH3 domain of the cell death agonist Bad. The peptide conjugate is cc gapptosis in cancer cells in the cell serial for inhibiting BCl-2 useful for modulating apoptosis in the cell gell for inhibiting BCl-2 (cc gapptosis in cancer cells. It is also useful for tracting a coute or chronic lymphocytic and non-lymphocytic laukemia, melanoma, or conjugate is also useful for treating a coute or chronic lymphocytic and non-lymphocytic laukemia. The peptide conjugate is also useful for treating a cc anote or chronic lymphocytic and non-lymphocytic laukemia. The peptide conjugate is also useful for treating a conjugate is also useful for treating disorders, acquired the conjugate is also call for treating a conjugate is acquired the conjugate is also call for treating a conjugate is conjugate is and conjugate is a conjugate is and conjugate is conj
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match 100.0%;

The invention relates to a peptide conjugate having the formula:

(C (R X)n peptide where n = 1-10; X = C-0, when the R-X group is attached to the N-terminus of the peptide, or a side chain of the peptide where the functional group of the side chain is MR2 or OH; or X = OOR NH.

CC when the R-X group is attached to the C-terminus of the peptide, or a CC side chain of the peptide, where the side chain functional group is coor to give the bonds. Cyclobutyl, cyclopentyl, 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 18; Page 19; 74pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptide conjugates for modulating apoptosis or for inhibiting gell lymphoma/leukemia 2 (Bgl-2) function especially useful for treating neurodegenerative disorders, stroke, or cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      2000-679325/66

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC (R-X)n-peptide where n = 1-10; X = C=0, when the R-X group is attached CC (R-X)n-peptide where n = 1-10; X = C=0, when the R-X group is attached CC to the Functional group of the peptide, or a side chain of the peptide where CC the functional group of the side chain is NH2 or OH; or X = O or NH.

CC when the R-X group is attached to the C-terminus of the peptide, or a CC side chain of the peptide, where the side chain functional group is COOH CC or two double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally CC monosubstituted with a 1-5C straight or branched chain of the peptide when a 1-5C straight or branched chain alkyl group, CC phenyl optionally monosubstituted with a 1-5C straight or branched chain CC alkyl group, or benzyl. The peptides AB37001-B37058 represent examples CC of the peptide portion of the conjugate. The peptides represent analogues CC of the peptide portion of the coplyagate. The peptide conjugate is useful for modulating apoptosis in the cells of a subject, or for CC two trains a cell lymphoma/leukemia 2 (Bc1-2)-mediated blockage of a poptosis in cancer cells. It is also useful for inhibiting Bc1-2 CC function. In particular, the peptide conjugate is useful for treating a consersion-small lung, renal or thyroid cancers, neuroblastoma, melanoma, or confidence or chronic lymphocytic and non-lymphocytic leukemia. The peptide conjugate is also useful for treating disorders characterized by immunodeficiency syndrome (AIDS), stroke or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC (R-X)n-peptide where n = 1-10; x - C-O, when the R-X group is attached CC to the N-terminus of the peptide, or a side chain of the peptide where CC the functional group of the side chain is NHZ or OH; or x = 0 or NH.

CC when the R-X group is attached to the C-terminus of the peptide, or a CC side chain of the peptide, where the side chain inctional group is COOH CC or CONH2; and R = 2-18C alkyl or alkoxy, 2-14C alkylenyl containing one CC or two double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally CC monosubstituted with a 1-5C straight or branched chain alkyl group, CC phenyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, CC phenyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, CC alkyl group, Or benzyl. The peptides AABJ701-3370% represent examples CC of the peptide portion of the conjugate. The peptides represent analogues CC the BH3 domain of the cell death agonist Bad. The peptide conjugate is useful for modulating apoptosis in the cells of a subject, or for CC acceptable of the cells. It is also useful for inhibiting BCl-2 conjugate is in cancer cells. It is also useful for treating a constant, read or thyroid cancers, neuroblastoma, melanoma, or caute or chronic lymphocytic and non-lymphocytic loukemia. The peptide conjugate is also useful for treating disorders characterized by concertized by increased apoptosis, e.g. neurodegenerative disorders, acquired immunodeficiency syndrome (AIDS), stroke or myocardial infarction.

                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a peptide conjugate having the formula:

CC (R-X)n-peptide where n = 1-10: X = C=0, when the R-X group is attached cc to the N-terminus of the peptide, or a side chain of the peptide where cC the functional group of the side chain is NH2 or OH; or X = O OR NH, CC when the R-X group is attached to the C-terminus of the peptide, or a cc side chain of the peptide, where the side chain functional group is COOH CC or CONH2; and R = 2-18C alkyl or alkoxy, 2-14C alkylenyl containing one CC or two double bonds, cyclobutyl, cyclopentyl, cyclopexyl optionally cc phenyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, CC phenyl optionally monosubstituted with a 1-5C straight or branched chain CC alkyl group, or benzyl. The peptides AAA37001-B37058 represent analogues CC of the peptide portion of the conjugate. The peptide conjugate is cof a Bcl-2 superfamily polypeptide corresponding to amino acids 72-97 of CC the BH3 domain of the cell death agonist Bad. The peptide conjugate is capoptosis in cancer cells. It is also useful for inhibiting Bcl-2 CC apoptosis in cancer cells. It is also useful for inhibiting Bcl-2 CC superess Bcl-2. The cancer includes prostate, colorectal, gastric, CC non-small lung, renal or thyroid cancers, neuroblastoma, melanoma, or caute or chronic lymphocytic and non-lymphocytic lewkemia. The peptide conjugate is also useful for treating a colorectal, gastric, c. g. neurodegenerative disorders, acquired by infuned ficiency syndrome (AIDS), stroke or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                      Query Match

promoter protein.

```
The present invention describes an isolated or synthetic polypeptide (1) comprising a less than full length amino acid sequence of a mutant Bel-XL/Bel-2 associated cell death regulator polypeptide (BAD) or its fragment, which contains amino acid substitutions at Serll8 of a human BAD, Serl55 of a murine BAD (longer murine BAD) or Serl13 of a murine BAD (longer murine BAD) or Serl13 of a murine BAD, (longer murine BAD) or Serl13 of a murine BAD (longer murine BAD) or Serl13 of a murine BAD, antistriblemenic, vulnerary, cytostatic, antiviral antistriblemenic, vulnerary, cytostatic, antiviral antistriblemenic, vulnerary, cytostatic, antiviral antistriblemenic, antistriblemenic, vulnerary, cytostatic, antiviral antistriblemenic, antistriblemenic, vulnerary, cytostatic, antiviral can be used as an apportosis inducer or inhibitor. BAD polypeptides and polypeptides and polypeptides and compounds and drugs for activity that promote cell survival or apoptosis. Other uses include inducting or inhibiting apoptosis in a cell. Candidate compounds inducting or inhibiting apoptosis in a cell. Candidate compounds infections, immunodeficiency diseases, neurodegenerative diseases, isohamic cell death, reperfusion cell death, wound healing, cancer, viral infections, lymphoproliferative conditions, arthritis, infertility, inflammation and autoimmune diseases. The present sequence represents a specifically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 7; Page 148-149; 157pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New mutant Bcl-XL/Bcl-2 Associated Cell Death Regulator polypeptide, useful for screening for candidate compounds which induce or inhibit apoptosis, comprises amino acid substitutions at Seril8, Seri55 or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents the murine bcl-x(L)/bcl-2 associated death corrector (Bad) gene. Bad is a 22.1 kD protein which interacts with CC bcl-2 and bcl-x proteins and regulates cell death. It has bomology to the bcl-2-related family clustered in the BH and H2 domain. Bad CC has been found to hybridise to bcl-x(L) and bcl-2 in yeast two-hybrid CC assays and in vivo in mammalian cells. Overexpressed Bad counters the CC death inhibitory activity of bcl-x(L), but is much less effective at countering the death inhibitory activity of bcl-2. Bad expression can accelerate apoptotic cell death induced by cytokine deprivation in an CC II-3 dependent cell line expressing bcl-x(L), and its also counters the CC death repressor activity of bcl-x(L). Bad competes with Bax for binding CC binding to bcl-2 or bcl-x(L) bed cytokine deprivation in an CC II-3 dependent cell line expressing bcl-x(L), and tax for binding CC binding to bcl-2 or bcl-x(L) to form heterodimers. Such agents may be used to treat neurodepenerative diseases, immunodeficiency diseases, cc e.g. AIDS, senescence or ischaemia.
                                                                                                                                                                                                                                                                                                                                                      Query Match

```
Chesth regulator) proteins, having an amino acid other than Set at cosistion 112 and/or 136, relative to the murine BAD 204 as sequence. The coposition 121 and/or 136, relative to the murine BAD 204 as sequence. The CC present sequence is the murine BAD protein. Also described are: (1) CC fragments of mutant BAD protein able to decrease cell viability; (2) CC fusion proteins of mutant BAD protein able to decrease cell viability; (2) CC increases intracellular delivery. Nutant BAD proteins are used to treat CC or prevent diseases associated with reduced apoptosis, e.g. cancer, CC inflammation and autoimmune disease. Polynucleotide sequences encoding CC mutant BAD proteins can be used similarly by gene therapy or to produce CC transgenic animals for use as disease models or in drug screening. BAD cc proteins phosphorylated at specified ser are used to screen for enhancers CC and inhibitors of serine-phosphatase. Inhibitors are potentially useful CC in treatment of excessive apoptosis such as AIDS, neurodegeneration, CC aging or ischamic cell death. The apoptotic status of cells is cells in treatment of excessive apoptosis such as AIDS, neurodegeneration, CC phosphorylated BAD, by usual immunoassays. Mutant BAD proteins have composited that does not contend activity than wild-type BAD which can become CC proteins in the specified Ser, forming a product that does not cheterodimerise with BCL-2 or BCL-XL but instead binds to 14-3-3 amily CC proteins in the cytosol, thus promoting cell survival. The mutants with XX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New mutant BAD polypeptide with phosphorylatable serine replaced viseful for, e.g. treating reduced apoptosis such as in cancer or viral infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1; Fig 10; 95pp; English

                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell Cd death regulator) proteins, having an amino acid other than Ser at CD position 112 and/or 136, relative to the murine BAD 204 as sequence. The position 12 and/or 136, relative to the murine BAD 204 as sequence. The CD position proteins of mutant BAD protein able to decrease cell viability (3) CC increases intracellular delivery. Mutant BAD proteins are used to treat to revent diseases associated with reduced apoptosis, e.g. cancer, ... CC viral infection, lymphoproliferation, arthritis, infertility, cc inflammation and autoimmune disease. Polynucleotide sequences encoding that DBD proteins can be used similarly by gene therapy or to produce transgenic enimals for use as disease models or in drug screening, BAD cc proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, call death. The apoptotic status of cells is aging or ischemic cell death. The apoptotic status of cells have cc greater death-promoting activity than wild-type BAD which can become composition on the specified Ser, forming a product that does not the terrodimerise with BCL-2 or BCL-XL but instead binds to 14-3-3 family cc proteins in the cytosol, thus promoting cell survival. The mutants with BCC Ser substituted cannot bind 14-3-3.
                                                                                                                                                                                                                                                                                         Query Match

The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell Cdeath regulator) proteins, having an amino acid other than Ser at CC position 112 and/or 136, relative to the murine BAD 204 as sequence. The present sequence represents a mutant BAD protein able to decrease cell viability. (2) CC fragments of mutant BAD protein able to decrease cell viability (2) CC fusion proteins of mutant BAD protein able to decrease cell viability (2) CC fusion proteins of mutant BAD protein able to decrease cell viability. (2) CC virely interest of mutant BAD proteins are used to treat CC or prevent diseases associated with reduced approteins, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, continued the proteins and autoimmune disease models or in drug screening. (2) CC viral infection, lymphoproliferation, arthritis, infertility, continued to the produce cransgenic animals for use as disease models or in drug screening. (3) CC proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatuse. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, cell death. The apoptotic status of cells is determined by measuring relative amounts of phosphorylated and non-phosphorylated and non-phosphorylated on the specified Ser, forming a product that does not the hotological proteins in the cytosol, thus promoting cell survival. The mutants with CC proteins in the cytosol, thus promoting cell survival. The mutants with axis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New mutant BAD polypeptide with phosphorylatable serine replaced useful for, e.g. treating reduced apoptosis such as in cancer or viral infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 7; Page 60; 95pp; English.

                                                                                                                                                                                                                                                                                                                                                                                             CC death regulator) proteins, having an amino acid other than Ser at CC position 112 and/or 136, relative to the murine BAD 204 as sequence. The CC position 112 and/or 136, relative to the murine BAD 204 as sequence. The CC present sequence represents a mutant BAD protein Also described are: (1) CC fragments of mutant BAD protein able to decrease cell viability; (2) CC fusion proteins of mutant BAD protein able to decrease cell viability; (2) CC fusion proteins of mutant BAD with a heterologous polypeptide that CC or prevent diseases associated with reduced apoptosis, e.g. cancer, CC viral infection, lymphoproliferation, arthritis, infertility, contains and autoimmune disease. Polynucleotide sequences encoding CC inflammation and autoimmune disease. Polynucleotide sequences encoding CC mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD CC proteins phosphorylated at specified Ser are used to screen for enhancers CC and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, CC determined by measuring relative amounts of phosphorylated and nonce the specified Ser, forming a product that does not phosphorylated on the specified Ser, forming a product that does not the total sering with BCL-2 or BCL-XL but instead binds to 14-3-3 family CC proteins in the cytosol, thus promoting cell survival. The mutants with

The serine residue is phosporylated in a post-translational modification and allows binding to the 14-3-3 protein which is a signal transduction regulator. Modulators of phosphorylated BAD, which act through inhibition/activation of a phosphoserine phosphatase, are useful for preventing/treating increased/decreased apoptosis in a cell. The increased apoptosis may result from immunodeficiency diseases, sensescence, neurodegenerative disease, ischaemic cell death, reperfusion cell death, infertility and wound-healing. Decreased apoptosis may result from cancer, viral infection, lymphoproliferative conditions, arthritis, infertility, infertility, and autoimmune diseases. Measuring the amount of phosphorylated compared to unphosphorylated BAD polypeptide and/or total BAD in a cell is useful for determining the apoptotic state of a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          serine phosphorylation; post-translational modification; apoptosis; signal transduction regulator; phosphoserine phosphatase; senescence; immunodeficiency disease; neurodegenerative disease; infertility; cancer, viral infection; lymphoproliferative condition; arthritis; inflammation; autoimmune diseases.

                                                                                                                                                                                                                                                      RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes an isolated or synthetic polypeptide (I) comprising a less than full length amino acid sequence of a mutant Bcl-XL/Bcl-2 associated cell death regulator polypeptide (BAD) or its fragment, which contains amino acid substitutions at Serila of a human BAD, Seril5 of a murine BAD (longer murine BAD) or Seril3 of a murine BAD). (I) has immunostimulant, neuroprotective, nootropic, antilischaemic, vulnerary, cycostatic, antiviral, can be used as an apoptosis inducer or inhibitor. BAD polypeptides and can be used for screening candidate compounds and drugs for activity that promote cell survival or apoptosis. Other uses include clinducing or inhibiting apoptosis in a cell. Candidate compounds and drugs identified and (mutant) BAD polypeptides are useful in treating clentified and (mutant) BAD polypeptides are useful in treating conditions, artificative conditions, artifitis, infertility, inflammation and autoimmune diseases. The present sequence represents a specifically claimed longer murine BAD mutant amino acid sequence from the present
                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                             RESULT
                                                                                                                                                                                                                                                                                                                                                          CC functional appotosis-modifying fusion protein is capable of binding a carryon transfer cell. The apoptosis-modifying fusion protein comprises at least two domains: the DTR domain, which targets the fusion protein to the CC target cell and the Bcl-XL domain, which modifies an apoptotic response of the target cell and the Bcl-XL domain, which modifies an apoptotic response of the target cell. The fusion protein is useful for modifying (inhibiting or enhancing) apoptosis in a target cell, such as neuron, CC lymphocyte, cancer, neoplasm, macrophage, epithelial, stem, tumour or hyper-proliferative cell or an adipocyte. It is also useful for reducing apoptosis in a subject after translent ischaemic neuronal injury. The fusion protein may be used to treat carrous diseases and injury. The fusion protein may be used to treat various diseases and injury conditions through inhibition or enhancement of apoptotic cellular response, including neurodegenerative disorders catrophy, stroke episodes and unregulated cell growth as in tumours and various cancers. The apoptosis-modifying fusion protein can be delivered cellular throughout the body and targeted to selective tissue and

The sequence is disclosed as being a protein called BBC6 which regulates cell death through interaction with Bcl-2. The DNA may be used for the production of the recombinant protein, which can be used in unspecified therapeutic or diagnostic procedures, as a molecular weight marker, and to raise antibodies that can be used in unspecified diagnostic or therapeutic applications and to reduce or eliminate the biological activity of the BBC6 protein in vivo.
                                                                                                                                                                                                                                                                                                                                                               Claim 1; Column 11-12; 7pp; English.

         Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                  48

A:Map position: 2R
A:Map position: 2R
C:Function:
C:Function:
A:Description: aldehyde-lyase; carbon-carbon lyase
A:Pathway: aromatic amino acid biosynthesis; shikimate pathway
A:Note: first step in shikimate pathway
A:Note: first step in shikimate pathway
C:Superfamily: phospho-2-dehydro-3-deoxyheptonate aldolase
C:Keywords: aldehyde-lyase; aromatic amino acid biosynthesis; carbon-carbon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A. in Function: Promotes cell death. Successfully competes for the binding to Bcl-x(L), Bcl-2 and Bcl-w, thereby affecting the level of heterodimerization of these proteins with BAX. Can reverse the death repressor activity of Bcl-x(L), but not that of Bcl-2. Appears to act as a link between growth factor receptor signaling and the apoptotic pathways.

-: SUBUNIT: Forms heterodimers with the anti-apoptotic proteins, Bcl-x(L), Bcl-2 and Bcl-w. Also binds protein S100A10 (By similarity). The Ser-112/Ser-136 phosphorylated form binds 14-3-3 proteins.

-: SUBCELLULAR LOCATION: Outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm.

-: DOMAIN: Intact BH3 domain is required by BIK, BID, BAK, BAD AND BAX for their pro-apoptotic activity and for their interaction with anti-apoptotic members of the Bcl-2 family.

-: PYM: Phosphorylated on Ser-112 in response to survival stimuli. Subsequent phosphorylation on Ser-136 promotes heterodimerization with 14-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-155, a site within the BH3 domain, leading to the release of Bcl-x(L) and the promotion of cell survival.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      01-NOV-1997 (Rel. 35, Created)

"Functional characterization of two splice variants of rat BAD and their interaction with Bcl-w in sympathetic neurons.";

Whol. Cell. Neurosci. 17:97-106(2001).

"Itheir interaction with Bcl-w in sympathetic neurons.";

Wol. Cell. Neurosci. 17:97-106(2001).

"Itheir interaction with Bcl-w interest for the bunding to Bcl-x(L), Buccessfully competes for the binding to Bcl-x(L), Buccessfully competes for the level confliction of these proteins with BAX. Can reverse the death repressor activity of Bcl-x(L), but not that of Bcl-2 (By similarity). Appears to act as a link between growth factor receptor signaling and the apoptotic pathways.

"Itheir interest in a summary in a su
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     EMBL; AF003523; AAC53374.1; -. PTM: Phosphorylated on Ser-131 in response to survival stimuli. Subsequent phosphorylation on Ser-137 promotes heterodimerization with 14-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-156, a site within the BH3 domain, leading to the release of Bcl-x(L) and the promotion of cell survival. Ser-137 is the major site of AKT/PKB phosphorylation, Ser-156 the major site of protein kinase A (CAPK) phosphorylation (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SIMILARITY: CONTAINS A BCL-3 HOMOLOGY DOMAIN 3 (BH3).
SIMILARITY: BELONGS TO THE BCL-2 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       brain, liver, spleen and heart. In the brain, restricted to epithelial cells of the choroid plexus. Isoform alpha is the meabundant form.

                                                              binding to Bcl-x(L), Bcl-2 and Bcl-w, thereby affecting the of heterodimerization of these proteins with BAX. Can reverse death repressor activity of Bcl-x(L), but not that of Bcl-2 similarity). Appears to act as a link between growth factor receptor signaling and the apoptotic pathways. SUBUNIT: Forms heterodimers with the anti-apoptotic proteins x(L), Bcl-2 and Bcl-w. Also binds protein S100Al0 (By similar The Ser-75/Ser-99 phosphorylated form binds 14-3-3 proteins similarity).

SUBCELULIAR LOCATION: Outer mitochondrial membrane. Upon
SUBCELLULAR LOCATION: Outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm.
TISSUE SPECIFICITY: EXPRESSED IN A WIDE VARIETY OF TISSUES.
DOMAIN: Intact BH3 domain is required by BIK, BID, BAK, BAL BAX for their pro-apoptotic activity and for their interact with anti-apoptotic members of the Bcl-2 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NLWAAQRYGRELRRMSDEFEGSFKGL 166

Subsequent phosphorylation on Ser-99 promotes heterodimerization with 14-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-118, a site within the BH3 domain, leading to the release of Bcl-x(L) and the promotion of cell survival. Ser-99 is the major site of AKT/PKB phosphorylation, Ser-118 the major site of protein kinase A (CAPK) phosphorylation (by

SIMUNIT: I -ALPHA-I PLASMA PROTEASE INHIBITORS ARE ASSEMBLED FROM ONE OR TWO HEAVY CHAINS (H1, H2 OR H3) AND ONE LIGHT CHAIN, ONE OR TWO HEAVY CHAINS (H1, H2 OR H3) AND ONE LIGHT CHAIN, BIKUNIN. INTER-ALPHA-INHIBITOR (I-ALPHA-I) IS COMPOSED OF H1, H2 AND BIKUNIN, INTER-ALPHA-INHIBITOR (P-ALPHA-I) OF H2 AND BIKUNIN, AND PRE-ALPHA-INHIBITOR (P-ALPHA-I) OF H3 AND BIKUNIN.

PTM: HEAVY CHAINS ARE INTERLINKED WITH BIKUNIN VIA A CHONDROITIN 4-SULFATE BRIDGE TO THE THEIR C-TERMINAL ASPARTATE (BY SIMILARITY: BELONGS TO THE ITH FAMILY.

1- SIMILARITY: BELONGS TO THE ITH FAMILY.
